Run on: MPsrch_pp protein - protein database search, using Smith-Waterman algorithm Mon Nov 30 13:09:25 1998; MasPar time 7.16 Seconds 827.945 Million cell updates/sec

Tabular output not generated.

Title: >US-09-033-662-2 (1-221) from US09033662.pep

Description: Perfect Score:

Sequence: 1 MRRCRISGRPPAPPGVPAQA......CQGRGLELNPDTCRCRKLRR 221

Scoring table: TABLE unitprotable Gap 60

74019 segs, 26840295 residues

Post-processing: Minimum Match 0% Listing first 100 summaries

Database: swiss-prot35 1:swissprot

Statistics: Mean 3.428; . Variance 0.401; scale 8.545

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

T tumours, inflammation or rheumatoid arthritis

Claim II; Page 44; 56pp; English.

This sequence is that of human vascular endothelial growth factor 3 (VEGF3). The growth factor can be used to stimulate angiogenesis and wound healing, and to promote vascular tissue repair. It can also be used to induce the growth of damaged bone, periodontium or ligament tissue. VEGF3 antagonists can be used to inhibit tumour growth, or to treat diabetic retinopathy, inflammation, rheumatoid arthritis or psoriasis. VEGF3 is structurally related to the PDGF/VEGF family and it includes the conserved signature motif for the family (see features table).

PT and antibodies for cancer diagnosis
PS Claim 18; Page 62; 107pp; English.
CC W04824-W04831 represent the vascular endothelial growth factor (VEGF)
CC proteins of the invention, which promote endothelial or mesodermal ceil
CC proteins of the invention, which promote endothelial or mesodermal ceil
CC proteins of the invention, which promote endothelial or mesodermal ceil
CC proteins of the invention, which promote endothelial or mesodermal ceil
CC proteins of the invention, which promote endothelial or mesodermal ceil
CC sometimes referred to as vascular permeability factor (VPF). VEGF has
CC diverse effects, depending on the specific biological context in which is
CC is found. VEGF is also a glycosylated carling endothelial
CC contributes to induction of angiogenesis in vivo by promoting endothelial
CC tissue regeneration/reorganisation. The VEGF proteins of the invention
CC share the angiogenic and other properties of VEGF, but are distributed
CC and expressed in tissues differently to VEGF. The proteins can therefore
CC be used to accelerate angiogenesis in wound healing. Antibodies against
CC complementary to the coding sequences for the proteins of the invention
CC can also be used for inhibiting angiogenesis. The antibodies can
CC can also be used to detect VEGF-B coding sequences. Quantification of
CC VEGF B in cancer biopsy specimens may be useful as an indicator of
CC metastatic risk. VEGF-B expression in a cell can be retarded using
CC especially useful in retarding VEGF expression in tumour cells.

Human vascular endothelial growth factor (VEGF)-like polypeptide (W00725) is capable inducing the proliferation of vascular endothelial cells, of interacting with fit-1/fkl-1 receptors, and of inducing cell migration, cell survival and/or an increase in intracellular levels of alkaline phosphatase. It shows 33.3% identity with human VEGF (see also W00724). Splice variants (W00726-28) of SOM175 have also been identified. Recombinant SOM175 can be produced in host cells transformed with vectors carrying SOM175 CDNA (see also 733610). It is useful for inducing astroglial proliferation and for promoting neural survival and/or proliferation. Sequence 207 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  06-SEP-1996;

                                                                                                                                                                                      Claim 12; Page 42-43; 113pp; English. Splice variants (W00726-28) of the human vascular endothelial growth factor-like polypeptide SOM175 (see also W00725) are products of cDNA clones (see also T33611-13) respectively lacking exon 6, exons 6+7, and exon 4 of the SOM175 gene (see also T33610). They show at least 1 of the properties of SOM175 including the ability to induce proliferation of vascular endothelial cells, to interact with fit-1/fik-1 receptors, and to induce cell migration, cell survival and/or an increase in intracellular levels of alkaline phosphatase. Recombinant SOM175 proteins can be used to induce astroglial proliferation and to promote neural survival and/or proliferation. Sequence 188 AA;

PT and antibodies for cancer diagnosis
Claim 18; Page 59; 107pp; English.
CC W04824-W04831 represent the vascular endothelial growth factor (VEGF)
CC proteins of the invention, which promote endothelial or mesodermal cell
CC proteins of the invention, which promote endothelial or mesodermal cell
CC proliferation. VEGF is also a glycosylated cationic dimer, and is
CC diverse effects, depending on the specific biological context in which it
CC is found. VEGF is a potent endothelial cell mitogen, and directly
CC contributes to induction of angiogenesis in vivo by promoting endothelial
CC tissue regeneration/reorganisation. The VEGF proteins of the invention
CC cell growth during normal embryonic development, wound healing, and
CC tissue regeneration/reorganisation. The VEGF proteins of the invention
CC can dexpressed in tissues differently to VEGF. The proteins can therefore
CC be used to accelerate angiogenesis in wound healing. Antibodies against
CC the proteins can be used for inhibiting angiogenesis. The antibodies can
CC complementary to the coding sequences for the proteins of the invention
CC can also be used for detect VEGF-B coding sequences. Owantification of
CC weff-B in cancer biopsy specimens may be useful as an indicator of
CC metastatic risk. VEGF-B expression in a cell can be retarded using
CC especially useful in retarding VEGF expression in tumour cells.

GILLIMOND S, HAYWARD NK,
Vascular endothelial growth factor VEGF-B proteins - useful to accelerate anglogenesis in wound healing, also related nucleic acid and antibodies for cancer diagnosis claim 18; Page 53-54; 107pp; English.

W04824-W04831 represent the vascular endothelial growth factor (VEGE) proteins of the invention, which promote endothelial or mesodermal (CC) proliferation. VEGF is also a glycosylated cationic dimer; and is sometimes referred to as vascular permeability factor (VPF). VEGE has diverse effects, depending on the specific biological context in which is found. VEGF is a potent endothelial cell mitogen, and directly contributes to induction of anglogenesis in vivo by promoting endothelial cell growth during normal embryonic development, wound healing, and
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Vascular endothelial growth factor fragment #1.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      splice variants (W00726-28) of the human vascular endothelial growth factor-like polypeptide SOM175 (see also W00725) are products of cDNA clones (see also T33611-13) respectively lacking exon 6, exons 6+7, and exon 4 of the SOM175 gene (see also T3361). They show at least 1 of the properties of SOM175 including the ability to induce proliferation of vascular endothelial cells, to interact with flt-L/flk-1 receptors, and to induce cell migration, cell survival and/or an increase in intracellular levels of alkaline phosphatase. Recombinant SOM175 proteins can be used to induce astrogical
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             WO9626736-A1.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                W04824;

CC proteins of the invention, which promote andothelial or mesodermal cell conditions of the invention, which promote andothelial or mesodermal cell conditions referred to as vascular permeability factor (VPF). VEGF has conditioned dimer, and is conditioned from the specific biological context in which it is found. VEGF is a potent endothelial cell mitogen, and directly contributes to induction of angiogenesis in vivo by promoting endothelial cell growth during normal embryonic development, wound healing, and conditions are the angiogenic and other properties of VEGF, but are distributed and expressed in tissues differently to VEGF, but are distributed conditions can be used for inhibiting angiogenesis. The antibodies can also be used to accelerate angiogenesis in wound healing. Antibodies can also be used to detect VEGF-B coding sequences. Ouantification of CC vEGF-B in cancer biopsy specimens may be useful as an indicator of constantic risk. VEGF-B expression in a cell can be retarded using antisense sequences direct against the VEGF coding sequences, this is especially useful in retarding VEGF expression in tumour cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Matches

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         tissue regeneration/reorganisation. The VEGF proteins of the invention share the angiogenic and other properties of VEGF, but are distributed and expressed in tissues differently to VEGF. The proteins can therefore be used to accelerate angiogenesis in wound healing. Antibodies against the proteins can be used for inhibiting angiogenesis. The antibodies can also be used diagnostically to quantitatively detect VEGF-B. Primers complementary to the coding sequences for the proteins of the invention can also be used to detect VEGF-B coding sequences. Quantification of VEGF-B in cancer biopsy specimens may be useful as an indicator of metastatic risk. VEGF-B expression in a cell can be retarded using antisense sequences direct against the VEGF coding sequences, this is especially useful in retarding VEGF expression in tumour cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Vascular endothelial growth factor-B112.

CC W04824-W04831 represent the vascular endothelial growth factor (VEGF)

CC proteins of the invention, which promote endothelial or mesodermal cell

CC sometimes referred to as vascular permeability factor (VPF). VEGF has

CC diverse effects, depending on the specific biological context in which it

CC is found. VEGF is a potent endothelial cell mitogen, and directly

CC contributes to induction of anglogenesis in vivo by promoting endothelial

CC cell growth during normal embryonic development, wound healing, and

CC tissue regeneration/teorganisation. The VEGF proteins of the invention

CC share the anglogenic and other properties of VEGF, but are distributed

CC and expressed in tissues differently to VEGF but are distributed

CC and expressed in tissues differently to VEGF. The proteins can therefore

CC be used to accelerate anglogenesis in wound healing. Antibodies can look be used diagnostically to quantitatively detect VEGF B. Primers

CC complementary to the coding sequences for the proteins of the invention

CC VEGF B in cancer blopsy specimens may be useful as an indicator of

CC VEGF B in cancer blopsy specimens may be useful as an indicator of

CC vegeratatic risk. VEGF B expression in a cell can be retarded using

CC especially useful in retarding VEGF expression in tumour cells.

Claim 18; Page 60-61; 107pp; English.

W04824-W04831 represent the vascular endothelial growth factor (VEGF) proteins of the invention, which promote endothelial or mesodermal cell proliferation. VEGF is also a glycosylated cationic dimer, and is sometimes referred to as vascular permeability factor (VPF). VEGF has diverse effects, depending on the specific biological context in which it is found. VEGF is a potent endothelial cell mitogen, and directly contributes to induction of angiogenesis in vivo by promoting endothelial cell growth during normal embryonic development, wound healing, and tissue regeneration/reorganisation. The VEGF proteins of the invention share the angiogenic and other properties of VEGF, but are distributed
                                                                                                                                                                                                                                                                                                                                                      Vascular endothelial growth factor VEGF-B proteins - useful to accelerate angiogenesis in wound healing, also related nucleic and antibodies for cancer diagnosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Vascular endothelial growth factor-B186.

WRF167 (W00863) is the murine homologue of an alternatively spliced variant (W00726) of human vascular endothelial growth factor-like variant (W00726) of promoting redothelial growth factor-like polypeptide SOM175 (W00725), a protein capable of inducing astroglial proliferation and of promoting neural survival and/or proliferation. Its amino acid sequence was deduced from a CDNA clone (T18810) isolated from a new-born mouse brain cDNA library. WRF167 shows 85% identity and 92% similarity to its human counterpart. It lacks 101 amino acids found in VRF186 (W00863), the murine homologue of SOM175, owing to a deletion of exon 6 during splicing.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 cancer; metastatic risk; tumour cell; mouse.

Antibodies against the proteins can be used for inhibiting angiogenesis. The antibodies can also be used diagnostically to quantitatively detect VEGF-B. Primers complementary to the coding sequences for the proteins of the invention can also be used to detect VEGF-B coding sequences. Quantification of VEGF-B in cancer blopsy specimens may be useful as an indicator of metastatic risk. VEGF-B expression in a cell can be retarded using antisense sequences direct against the VEGF coding sequences. This is especially useful in retarding VEGF expression in tumour cells.
                                                                                                                                                                                                                                                                                                                                     Example 5; Fig 9; 113pp; English.

Example 5; Fig 9; 113pp; English.

VRF186 (W00863) is the murine homologue of human vascular endothelial growth factor-like polypeptide SOM175 (W00725), a protein capable of inducing astroglial proliferation and of promoting neural survival and/or proliferation. Its amino acid sequence was deduced from a cDNA clone (T13809) isolated from a new-born mouse brain cDNA clone (T13809) isolated from a new-born mouse brain cDNA clone (T13809) isolated from a new-born mouse brain cDNA clone (T13809) isolated from a new-born mouse brain cDNA clone (T13809) isolated from a new-born mouse brain cDNA clone (T13809) isolated from a new-born mouse brain cDNA clone (T13809) isolated from a new-born mouse brain cDNA clone (T13809) isolated from a new-born mouse brain cDNA clone (T13809) isolated from a new-born mouse brain cDNA clone (T13809) isolated from a new-born mouse brain cDNA clone (T13809) isolated from a new-born mouse brain cDNA clone (T13809) isolated from a new-born mouse brain cDNA clone (T13809) isolated from a new-born mouse brain cDNA clone (T13809) isolated from a new-born mouse brain cDNA clone (T13809) isolated from a new-born mouse brain cDNA clone (T13809) isolated from a new-born mouse brain cDNA clone (T13809) isolated from a new-born mouse brain cDNA clone (T13809) isolated from a new-born mouse brain cDNA clone (T13809) isolated from a new-born mouse brain cDNA clone (T13809) isolated from a new-born mouse brain cDNA clone (T13809) isolated from a new-born mouse brain cDNA clone (T13809) isolated from a new-born mouse brain cDNA clone (T13809) isolated from a new-born mouse brain cDNA clone (T13809) isolated from a new-born mouse brain cDNA clone (T13809) isolated from a new-born mouse brain cDNA clone (T13809) isolated from a new-born mouse brain cDNA clone (T13809) isolated from a new-born mouse brain cDNA clone (T13809) isolated from a new-born mouse brain clone (T13809) isolated from a new-born mouse brain clone (T13809) isolated from a new-born mouse brain clone
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  W00863;
                                                                                                                                                                                                                                                                                                                      library.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           PS Claim 18; Page 56-57; 107pp; English.

CC W04824-W04831 represent the vascular endothelial growth factor (VEGF)

CC W04824-W04831 represent the vascular permote endothelial or mesodermal cell

CC proteins of the invention, which promote endothelial or mesodermal cell

CC proteins of the invention, which promote endothelial or mesodermal cell

CC grotiferation. VEGF is also a glycosylated cationic dimer, and is

CC diverse effects, depending on the specific biological context in which it

CC diverse effects, depending on the specific biological context in which it

CC diverse effects, depending on the specific biological context in which it

CC contributes to induction of angiogenesis in vivo by promoting endothelial

CC contributes to induction of angiogenesis in vivo by promoting endothelial

CC clisue regeneration/reorganisation. The VEGF proteins of the invention

CC share the angiogenic and other properties of VEGF, but are distributed

CC can expressed in tissues differently to VEGF. The proteins can therefore

CC be used to accelerate angiogenesis in wound healing. Antibodies can

CC also be used dispnostically to quantitatively detect VEGF-B. Primers

CC complementary to the coding sequences for the invention of

CC vectors also be used to detect VEGF-B coding sequences. Quantification of

CC vectors also be used to bopsy specimens may be useful as an indicator of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Query Match 15.8%;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              metastatic risk. VEGF-B expression in a cell can be retarded using antisense sequences direct against the VEGF coding sequences, this is especially useful in retarding VEGF expression in tumour cells.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Vascular endothelial growth factor VEGF-B proteins - useful to accelerate angiogenesis in wound healing, also related nucleic and antibodies for cancer diagnosis

Example 8; Page 31; 107pp; English.

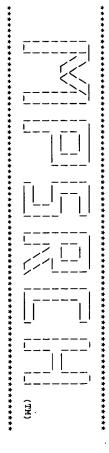

CC This sequence represents the N-terminal peptide of a vascular endothelial CC growth factor (VEGF) protein of the invention (see W04824-W04831). This capacitate of the invention (see W04824-W04831). This content human VEGF-B. VEGF is a plycosylated cationic dimer, which CC gromotes endothelial or mesodermal cell proliferation, and is sometimes CC effects, depending on the specific biological context in which it is CC found. VEGF is a potent endothelial cell mitogen, and directly CC contributes to induction of angiogenesis in vivo by promoting endothelial CC cell growth during normal embryonic development, wound healing, and CC etissue regeneration/reorganisation. The VEGF proteins of the invention Share the angiogenic and other properties of VEGF, but are distributed and expressed in tissues differently to VEGF. The proteins can therefore be used to accelerate angiogenesis in wound healing. Antibodies can the proteins can be used for inhibiting angiogenesis. The antibodies can also be used to detect VEGF-B coding sequences. Ouantification of VEGF-B in cancer biopsy specimens may be useful as an indicator of complementary to the coding sequences for the proteins of the invention of VEGF-B in cancer biopsy specimens may be useful as an indicator of metastatic risk. VEGF-B expression in a cell can be retarded using canting and coding sequences, this is especially useful in retarding VEGF expression in tumour cells.
